

Side Panel Latch

This latch was designed for the side panels of server racks. It has been well received by some of the largest rack manufacturers.

It is also used on wall mounted racks and other small indoor enclosures.

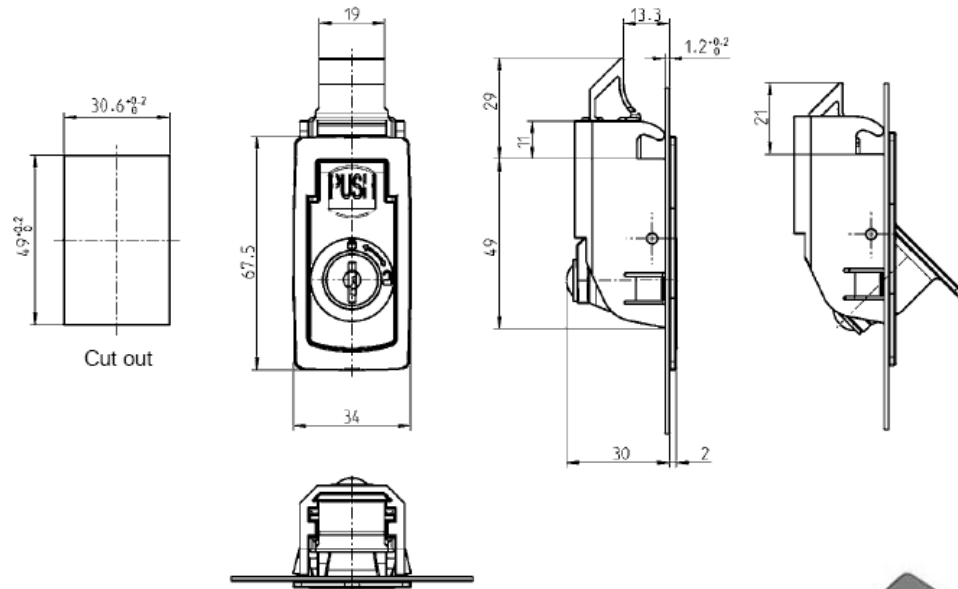

Security is extremely important. These latches can be incorporated into the EMKA Master key system. It is very important that the latches can be “slammed home” when locked.

For racks using EMKA’s Electronic access system alarms can be triggered.

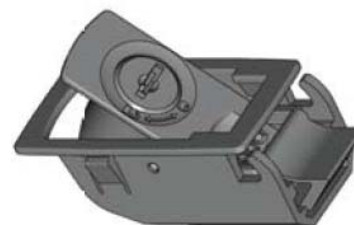

Latches that can be slammed shut must be rugged—they will be abused; this latch is more than 4 times stronger than the main competitive latch.

Latches snap-in to minimize total installed cost.

The lower cost non-locking latch can be used for racks in the middle of rows.

Lock Type	P/N
Keyed 333	1091-U143
Keyed different	1091-U143-01V
Non-locking	1091-U143-02
